CATALOGUE VOL.06
春 NEW COLLECTION 2024

From Waste To Resource

UPCYCLE

REUSE

REDUCE

Each piece has been designed to encourage others to not only think in terms of decoration but in terms of purpose and intent. This idea extends to how we repurpose agricultural byproducts and recycled plastics to manufacture our pots. Using byproducts such as coffee bean husk, bamboo fibre, wheat husk and recycled plastics, we are able to transform useless and unwanted materials into products with a functional purpose. We mix these with resin that is free of toxic chemicals such as phenol and formaldehyde to create our durable pots. With this process we are able to extract raw materials from production streams and reduce the need for new resources.

By finding sustainable methods to reuse waste materials we can also contribute to creating a more circular economy. In doing so, create new jobs and opportunities while remedying the environmental devastation caused by these harmful materials.

Wheat Husk

Bamboo Fibre

Coffee Bean Husk

Materials with a New Meaning

By giving wasted materials a new life, we are reducing the use of natural resources and minimizing the accumulation of new waste.

Bamboo Fiber

It is a type of cellulose fiber that is made from the pulp of the bamboo plant. Bamboo is an extremely renewable resource, as it grows much faster than trees, doesn't need fertilizer or pesticides to thrive, and doesn't need to be replanted after it is harvested.

Rice Husk

It is the outermost layer of the rice grain that is removed during the milling process. Rice husks are abundant and are a readily available biomass resource that can be used for insulation, fuel, building materials, and fertilizer.

Walnut Husk

Walnuts are the most widely cultivated nut trees in the world, and globally, over 3.3 million tons of shelled walnuts were produced in 2020 alone. Walnut husks account for almost 50% of this total weight, and multiple industries are now looking to make use of them, from biodiesel production to natural fiber reinforcements for composites.

Coffee Bean Husk

During the coffee bean hulling process, the fruits are de-seeded and dried, resulting in a strong husk. Most of this waste is dumped near the factories, which can lead to methane emissions and environmental degradation. Finding innovative solutions for this material is another way to reduce emissions and create a more circular economy.

Wheat Husk

It is the hard protective cover surrounding the grain. Although it is mainly seen as a waste material that is either ploughed into the soil or burned, we have also recognized it is a renewable resource for bio-based materials with interesting textures and properties.

Coco Coir

Also known as coconut fiber, it is a natural byproduct of coconut harvesting and is a sustainable alternative to peat moss. It is made from the coarse fibers extracted from the husk of coconuts. Coco coir has superior water-holding capacity, excellent air space and drainage, and it doesn't decompose as quickly as peat moss.

Signature Stone Recycled Plastics

Post-consumer recycled plastics account for 70% of our pots. We also mix in a small portion of stone & wood powder to elevate its natural textures.

Certifications

The objectives of the GRS are to ensure accurate recycled material claims, good working conditions, and that harmful environmental and chemical impacts are minimized.

The Amfori BSCI is a commitment that enables members and their business partners to exercise human rights due diligence and environmental protection in their global supply chains.

We have partnered with Carbon Zero to track and neutralize the greenhouse gas emissions generated from each shipment, including the carbon footprint of packaging materials.
